

During the coming week I want to learn how to use Android Studios, since I've never used it before. I downloaded it this week and started watching a youtube tutorial video which was recommended by the software engineers. Next week I will continue the tutorial (which is in total 11 hours) and hopefully put that tutorial to use with the help of the other team members.

One part of the assignment was to create a business model canvas. I was not the one to make it, but we business engineers could have been more clear in our description of what that koncept was to the software engineers. That's something we have been taught in an earlier course and that knowledge seemed new to the others. Moving forward I can make sure to better explain business engineer concepts.

So far we have not officially applied SCRUM. We have focused on getting the project scope in place as well as the development environment. We have now found our stakeholder with a project and features that they want. So going forward we can plan, sprint and reflect like SCRUM.

My contribution is a suggestion of a prototype, discussions about the business model canvas. And overall participation in this week's assignment. Moving forward I will make sure to do every task I'm assigned to and check up on teammates if I can help with anything.
