

This was the last sprint of the course and the project is done. Phew! After looking more into what the backend team has done and by asking questions, I've gotten a better understanding of the overall concept. Just like I wanted to last week. This IR will of course be different from the others because next week won't be any more work with the app. But where I am today and the way I understand SCRUM is not perfect and I understand that I have a lot of knowledge gap around this agile model. In the future I would like to know how to more correctly apply SCRUM, which practices are supposed to be done and how. What purpose do they have etc. I could learn this by reading about SCRUM, taking on another agile project or taking another course.

This week has been a mix of previous weeks. Sometimes I can teach another team member how to add certain elements in Android Studio. Sometimes I can help others learn by letting them teach me. In future projects I would love to contribute as much as I have and maybe a bit more. That would mean that I would need to be better at "studying" ahead, so I have a clear understanding of concepts and can explain them well.

This week I didn't do anything extra beyond our standard of working with stories, writing tasks, coding and keeping to the deadlines, meetings and reviews. I feel like the team has a better understanding of the SCRUM-practices overall in this stage of the course, of course not 100% but way better than the first week. During this week I also helped our SCRUM-master Ida by reminding her to send out digital daily scrums.

My contribution to the team deliveries was to add GUI-elements on different fragments since this week there have been a lot of bug fixes and general polish. Just like last week, I could work more and more independently as I have gained experience from Android Studios, which is really cool! In future projects I could contribute more by trying out more "backend" stories.
