

This week I got a good understanding of GUI elements in Android Studios, which was very cool! During this sprint retrospective we talked about applying MVVM-structure to our app which I have no prior knowledge of. A similar structure seems to be MVC which I know some of. By the end of the next sprint I'd like to know MVVM and how to categorize which components should be put where. To get there I will use resources like youtube and I will ask my team members to explain.

This week I could help some of my team members with basic things in Android Studio because I had done some research the week before. By doing this strategy again I can help with showing an example solution that could help solve a part of a bigger story.

This week I was the SCRUM-master and since I had little knowledge of what this meant I did some research and tried to apply that knowledge, for example I sent out a daily scrum. It seems to me like the team appreciated this. If I would be SCRUM-master again I'd continue with daily scrums and contribute to the group by encouraging more communication about the stories, problems etc.

My contribution to the team deliveries was the bottom navigation bar GUI and functionality, and started on the top bar GUI. I helped by programming and by suggesting solutions on any problem that arised with the help of youtube or google. I worked on it together with Jenny and Ida. We encountered errors on these stories and with the help of Omar and Eugene, Jenny could finish the last bits.
