

Last week I was looking forward to learning Android Studio more. This week our group has been focusing on stories, UML, structure, stakeholder and such. Thus I have not focused on AS as much as I thought I would last week. Until the next sprint members are encouraged to delve deeper into subjects relating to the project. So I will continue with tutorials on AS as this is something completely new to me in this course.

At this stage when we're setting up much of our developer environments I feel like I can't help the whole group in any particular way. However I can help those of us who have little knowledge of the technical aspects by asking a lot of questions and being almost too clear in discussions and summaries. Kind of like teachers usually saying that "if you're thinking about it, then someone else is probably thinking of it too"

I have not yet really grasped the concept of SCRUM and I so I have not been able to really make a strong contribution. In the future I'd like to contribute more to the application of SCRUM and make sure we do it in the right order. Going forward I will on my own read some literature on it and contribute to my group's use of SCRUM in the coming weeks.

My contribution to team deliveries have been user stories with a GUI-theme. To describe them and their confirmations and put them in Trello. I have been actively participating in meetings and written meetings notes. Going forward I imagine everyone getting more to work with and as this week I will make sure to complete the tasks I take on. I will also continue to actively participate in the meetings.
