W5 Individual reflection - **Jenny**

What do I want to learn or understand better?

This week I have continued to work with the GUI of the application. While doing this I've continued to learn new ways of using android studio. What I've not yet mastered though is how to properly customize different android components, so that they fit our design goals. Going forward I will try to learn more of how to do this and I think the best way to do so is to watch youtube tutorials and check different websites.

How can I help someone else, or the entire team, to learn something new?

This week I don't feel like I did anything new in terms of helping my team to learn something new. I've continued to co-learn with the team members that work with the GUI and android studio and I've helped some of my team-members with github. Going forward I feel like I might want to work a bit more with the design, not only by implementing the current design, but by improving the prototype's design decisions. While doing this I might be able help someone else to learn more about design principles etc, by including my team in the process.

What is my contribution towards the team's use of Scrum?

This week I've continued with my regular responsibility as the product owner. This includes communicating with our stakeholder and gathering required information for the product development. Other than this I have made sure to deliver what has been required of me but also deliver code in time so that my fellow group members use/implement it in their work.

What is my contribution towards the team's deliveries?

My contribution this week has been to finish three user stories together with other group members. I have also gathered inputs and feedback from the stakeholder during the sprint and for our sprint review. On top of this I've participated in our group meetings and I have actively communicated with my group during the sprint. Lastly I've done a fair amount of "debugging" while trying to make this week's GUI screen to look as requested. Unfortunately, while all the components got implemented, the design of them didn't meet the stakeholders expectations. This was due to lacking knowledge of customization of components, but also some time management issues. Next week I hope to fix the design issues from the previous week but also finish most of the rating part of the GUI.
